HTN, abnormal laboratory values, incision pain, and dysrhythmias warrant special consideration by the rehabilitation team. The new onsets of brady- or tachyarrhythmias are most frequent during the first postoperative week, and the most frequent abnormal rhythm is rapid atrial arrhythmias.\textsuperscript{19,20}

Transmyocardial revascularization (TMR) uses a surgical laser to create a channel in ischemic myocardium. This channel facilitates microcirculatory blood flow and possible new vessel formation (neovascularization/angiogenesis).
